"Marnotrawstwo węgla w okresie kapitalistycznej gospodarki". Przegląd Górnictwa, No. 9, 1951, pp. 335-342, 4 figs.

Capitalistic economy was destructive to the Upper Silesian coal deposits because only the best seams were worked and because of only partial recovery of coal easily won from the seams worked. The losses are estimated at about 55 per cent of the coal raised. Socialist economy reduces these losses to a minimum. Technical principles of this economy.

"Epidemic Situation of Poliomyelitis in Poland in 1961"

Warsaw, Przeglad Epidemiologiczny, Vol XVI, No 4, 1962,
pp369-375.

Abstract: /Authors: English summary modified/ The profound influence on the epidemiology, etiology and clinical picture of poliomyelitis of the introduction of mass immunization with attenuated polio vaccines in 1959 is discussed. Observations on the influence and effect of immunizations with such vaccines on the epidemic situation of poliomyelitis in Poland are reported. 4 tables, 2 diagrams; 5 Polish references.

AUTHOR: Arsenijevic, M. and Joranovic, R.

TITLE: Fireproofing and waterproofing textile materials.

PERIODICAL: Referativnyy zhurnal, Khimiya, no. 5, 1963, 650-651, abstract ST533
(Zast. Mater., 1962, v. 10, no. 1, 23-27)

TEXT: Laboratory experiments have shown that the impregnation of textile materials with ethyl-, butyl-, isopropyl- and amylytitanates in the form of a 2% gasoline solution imparts fire resistant and water resistant qualities to the cloth. The tested material both before and after washing or dry cleaning gave satisfactory results. Alcohol titanates were synthesized in this laboratory. Z. Lebedeva.

The effect of nitrogen mustard on the growth and metamorphosis of the tadpoles of *Rana temporaria*. S. Skowron and M. Jordan (Univ. Krakow, Poland). Bull. Intern. Acad. Polon. Sci., Classe Med. 1040, 13-17 (in English).—Concns. of methyl bis- β -chlorethylamine of 10^{-1} were lethal to small tadpoles while concns. of 10^{-3} produced transient growth inhibition. Larger tadpoles were less sensitive and concns. of 10^{-4} produced no effect after leg development. Old solns. or weaker concns. stimulated growth and metamorphosis and in some instances produced reduplication of hind limbs. Regeneration after amputations was stimulated by weak solns. and inhibited by lethal concns. Richard F. Riley

Nitrogen mustard as inhibitor of thyroid activity.
Stanislaw Skowron and Maria Jurkiewicz, Krakow,
Poland. *Bull. intern. med. polon.* v. 3, Clanc med.
1949, 111-130 (in English). Histological changes in the
thyroid evoked by 4-methyl-2-chloroacil are reversed by
administration of N-mustard. Thyroid glands of animals
treated with N-mustard, transplanted into animals re-
ceiving thiomuracil, showed no subsequent proliferative
change. It seems probable that N-mustard affects the
thyroid directly, not by mediation through the hypophysis.

✓ 3432. Further investigations on the effect of the cerebral system on the growth and regeneration in *Xenopus laevis* before and after metamorphosis. M. Jordan. Folie Biol. Warsaw, 1955, 8, 11-18. Telencephalon excision does not influence the course and rate of regeneration of the hind legs in *X. laevis* tadpoles. The tadpoles were operated on in stadium Ic (according to Blacher). Telencephalon excision in freshly metamorphosed toads does not influence the course and rate of toe regeneration. The excision of the telencephalon together with the didiencephalon in freshly metamorphosed toads inhibits the growth of regenerating toes. However, initial stages (i.e. formation of blastema and its differentiation) do not show any differences when compared with regenerated animals with the c.m.s. In fact, the growth of freshly metamorphosed toads after telencephalon excision does not proceed so rapidly as in the controls. The results show that in animals operated on immediately after metamorphosis a retardation of the growth processes takes place while in older animals no significant differences in comparison with the controls are visible. Title : Development of Some Fish After Fertilization with a Sperm Poisoned by Nitroperite.

Orig Pub : Folia biol. (Polska), 1956, 4, No 1, 35-44

Abstract : Degree of impairment in the development of ova of Esox lucius, Cyprinus carpio and Salmo trutta which were fertilized with sperm first poisoned with nitroperite depends on the dose of the poison. Its concentration at 10^{-2} maximally impair embryogenesis; weaker doses cause less disorder. In all cases the beginning stages of division in the experimental egg cells do not differ morphologically from the normal. First deviations are found in the late stages of division, and more often from the blastula stage.

"The Chromosomes of Man."

Krakow, Folia Biologica, Vol. 10, No 3-4, 1962; pp 314-315.

Abstract [English article]: Apparently a condensed version of a paper presented at the January 1962 Warsaw symposium on human genetics. Author found suitable mitoses for karyotype study in bone marrow of 19 out of 100 persons, found 48 chromosomes in unstated number of normal persons, 47 in 2 children with Turner's syndrome, 44 to 48 in a case of melanoklastoma, between 46 and 52 in x children with chondrodystrophy; prevalence of 46 in adrenogenital syndrome, with frequent poliploids. Conclusion: there are probably 2 karyotypes, 46, 47 and 48 respectively, in man; in agreement with Kodani, i.e. chromosomal polymorphism as occurs in *Sorex araneus*.

TITLE: Alkaloids of a form of thalictrum minus L. commonly found in Bulgaria

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 9, 1965, 849-851

TOPIC TAGS: plant chemistry, alkaloid, IR spectrum, chromatography

ABSTRACT: This article describes the first alkaloid-content investigation of the Thalictrum minus L. plant commonly found in Bulgaria. Its leaves resemble those of Thalictrum simplex. The article describes in details the experimental procedures, in particular the isolation of O-Methylthalmethin ($C_{17}H_{28}O_6N_2$), Thalmethin ($C_{16}H_{36}O_6N_2 \cdot H_2O$), and Berberin. Characteristic features of the various infrared spectra are also given. Alkaloids were proven by thin-layer chromatographic procedures. [Orig. art. in German] [JPRS: 34,903]

"The Significance of Egg Albumin for the Development of the Early Chick Embryo"

Sofia, Doklady Bolgarskoy Akademii Nauk, Vol 19, No 4, 1966, pp 321-324

Abstract: [English article] The part played by egg albumin in the early development of the chick embryo is usually reduced to providing in the yolk a pH suitable for growth (N. T. Spratt, Jr., J. Exptl. Zool., 106, 1947). The question whether other factors of albumin are significant in this period remains unresolved despite the utilization in recent years of albumin as a culture medium for chick blastoderm. To clarify this problem the author used a modification of the New's method for cultivating chick blastoderm. The results of the experiments, described in considerable detail, seem to indicate that 1) at an appropriate pH the yolk can provide for the growth and development of the blastoderm but only up to the 2-day stage; 2) necessary for the normal 3-day development of the blastoderm are some factors originating in the albumin in addition to the hydroxyl ionized water; 3) these factors are represented by micromolecular substances, probably peptides or amino acids (H. Walter, H. R. Mahler, J. Biol. Chem., 230, 1958). There are 2 Bulgarian, 1 Soviet, and 7 Western references. (Manuscript received, 29 Dec 65.)
